ABOUT ME

Java Backend Engineer with **5+ years** of experience building high-load distributed systems in fintech and mobility platforms. Led a team of engineers while developing and scaling microservices handling up to **3k RPS** and generating **$10M+ in monthly transactions**. Focused on improving reliability, latency, and scalability of production systems through event-driven architectures, database optimization, and cloud infrastructure.

SKILLS

Frameworks: Spring, Hibernate, MapStruct, Jakarta Validation
Databases & Storage: PostgreSQL, MongoDB, Redis, H2, Liquibase, Flyway, Amazon S3, MinIO
Messaging & Streaming: Apache Kafka, Confluent Schema Registry, RabbitMQ, Event-Driven Systems
DevOps & Infrastructure: Docker, Kubernetes, Jenkins, CI/CD, Git (GitHub/GitLab), Maven/Gradle, Linux, REST/OpenAPI
Testing & Observability: JUnit 5, Mockito, Testcontainers, JMeter, VisualVM, Prometheus, Grafana, Elasticsearch, Jaeger, AWS

EXPERIENCE

MAXIM: *08/2022 - Present*

- **Led a team of 4 backend engineers** responsible for a high-load ride pricing and order processing system handling up to **3-4k RPS** and supporting a platform generating **$10M+ in monthly ride transactions**.
- Reduced pricing calculation latency and stabilized ride quote responses under peak traffic, improving ride order conversion by **~21%**.
- Designed a reliable event publishing workflow between **PostgreSQL** and **Kafka** to guarantee consistent ride-processing events across downstream **microservices**.
- Reduced execution time of critical **PostgreSQL queries by 2×** by redesigning ride lookup queries and introducing composite indexes for active ride records.
- **Scaled backend services to handle up to 1k RPS** by introducing horizontal autoscaling and resource tuning in **Kubernetes**, preventing latency spikes during peak ride-booking traffic.
- Improved reliability of the event-driven processing pipeline by implementing **Kafka DLQ, retry with backoff** and **Avro + Schema Registry**, reducing message-processing incidents by **~62%**.
- Implemented a distributed caching mechanism (**Redis + Spring Cache**), **reducing database load by 47%** without SLA degradation.
- Enhanced the File Service by adding **versioning and file integrity verification via MD5 hashes**, which eliminated transfer corruption and reduced upload errors by **56%**.

ALLICA: 02/2021 - 07/*2022*

- Reduced payment processing failures from **~6% to <1.5%** by implementing resilient **REST integrations with external banking APIs** using retries, timeouts, and circuit-breaking mechanisms, supporting up to **12k transaction requests per day.**
- Improved platform reliability to **99.6% uptime** by redesigning the internal event queue processing and eliminating blocking operations in critical transaction flows.
- Automated processing of **Central Bank regulatory messages** by implementing end-to-end document validation and signing logic, **reducing** manual operator **involvement by ~80%**.

PROJECTS

- LINK-TRACKER - An application for tracking content updates via links. When new events appear, a notification is sent to Telegram.
- FRACTAL GENERATOR - A multithreaded fractal generator capable of creating exciting and colorful images based on mathematical principles of self-similarity.
- COOKAINNO - AI-powered application that analyzes photos of refrigerator contents and user preferences to suggest multi-day recipes and menus.

OTHER

EDUCATION
INNOPOLIS UNIVERSITY,
INNOPOLIS — BACHELOR'S DEGREE, *2022 – 2026*
Computer Science (Software Engineering)

LANGUAGES
English — C1 (Advanced)
Russian — Native
